

Know how your SharePoint sites are actually being used.

A lightweight SPFx analytics solution that captures modern SharePoint page activity into a hidden list and turns it into a site-level dashboard for page, user, and file usage insights.

SPFx

Deploys as a
SharePoint app
package.

List

Stores events in
the current site.

PDF

Print-ready
dashboard
exports.

Built for site owners and content teams

See which pages are viewed, who is engaging, how sessions flow, and which documents have Graph itemAnalytics signals without sending usage data to third-party analytics tools.

What it captures

- ✓ **Page and exit events**
Page views, session IDs, visit IDs, time on page, scroll depth, browser, device, and app version.
- ✓ **User-aware reporting**
Optional identity capture supports user-level engagement, sessions, latest activity, and average time trends.
- ✓ **File analytics pilot**
Uses Microsoft Graph itemAnalytics to surface sampled document viewer and access activity where available.

Why teams use it

- ✓ **No external analytics platform**
Events stay in SharePoint and use the current site's security model.
- ✓ **Threshold-aware reporting**
Dashboard reads indexed date slices and paged REST results to avoid unbounded list queries.
- ✓ **Admin-controlled access**
Site admins manage license, logo, theme, and dashboard audience from Settings.

Deployment path

- 1 Upload package**
Add SYTEK-SPAA.sppkg to the app catalog.
- 2 Add to site**
The app provisions hidden analytics and settings lists.
- 3 Open dashboard**
Use ?spanalytics=dashboard from any modern page.
